INTRODUCTION

Good morning/afternoon/evening, everyone.

My name is Sanket Ajay Chopade. I recently completed my Bachelor of Technology in 2025 in Aeronautical Engineering from Rashtrasant Tukadoji Maharaj Nagpur University. I have also completed a 9-month DevOps Engineer Internship at Hisan Labs, where I gained hands-on experience working with cloud and automation technologies.

During my internship, I worked with AWS, Terraform, Docker, Kubernetes, Jenkins, GitHub Actions, Linux, and monitoring tools such as Prometheus and Grafana. I was involved in building CI/CD pipelines, automating infrastructure deployment, managing cloud resources, and supporting production environments.

Some of my notable projects include a Three-Tier DevSecOps Project on AWS EKS and a Cloud-Native GitOps Delivery Pipeline, where I implemented infrastructure automation, container orchestration, and continuous deployment practices.

One of my key strengths is my willingness to learn and adapt quickly. I enjoy exploring new technologies, building hands-on projects, and solving technical challenges.

My career goal is to grow as a DevOps and Cloud Engineer, helping organizations build scalable, secure, and reliable infrastructure while continuously expanding my technical expertise.

Thank you for your time.

E-Commerce Application Project – DevOps Internship

During my DevOps internship, I worked on an e-commerce application used for online shopping. Due to a Non-Disclosure Agreement (NDA) between the company and its client, I cannot share specific project details. However, I can explain the project's overall architecture and my responsibilities.

The application was built using a microservices architecture, where the system was divided into multiple independent services. This made it easier to develop, update, maintain, and scale different parts of the application without affecting the entire system.

The application consisted of three main layers:

- **Frontend Layer:** Provided the user interface for customers to browse products, place orders, and interact with the platform.
- **Backend Layer:** Handled business logic, user requests, and communication between services.
- **Database Layer:** Stored application data such as user information, product details, and order records.

The development team followed the Agile methodology and worked in short development cycles called sprints. Daily stand-up meetings were conducted to discuss progress, resolve issues, and plan upcoming tasks. At the end of each sprint, the team reviewed completed work and prepared the application for testing and deployment.

As a DevOps Intern, I worked under the guidance of a Senior DevOps Engineer and gained hands-on experience with modern DevOps practices. My responsibilities included:

- Assisting in managing source code repositories using GitHub.
- Supporting CI/CD pipelines for automated build and deployment processes.
- Working with Docker containers and Kubernetes for application deployment.
- Assisting with AWS cloud infrastructure management.
- Using Terraform for infrastructure provisioning and automation.
- Monitoring application health and performance using Datadog.
- Supporting deployment activities and maintaining development and testing environments.

The project used several DevOps tools and technologies, including GitHub, Jenkins, Docker, Kubernetes, Terraform, Datadog, and AWS.

Through this internship, I gained practical experience in cloud computing, automation, infrastructure management, CI/CD, monitoring, and deployment processes. Working with experienced engineers helped me understand how applications move from development to production in a real-world DevOps environment.
